My site is targeted at those who are animal lovers but not sure what pandas are. I schemed my website color in black and gray, because these two colors correspond to what pandas look like. I set a fixed header so that wherever you are on the page, you could easily go to other pages without going back to the top. I made this website interesting by creating a quiz question on the website content. This setup stimulates readers to read the content and makes them realize how adorable pandas are. I made the website neat yet very informative. Considering I am targeting at those who have little knowledge about pandas, I put a lot of interesting facts and interesting links on my web to make it more educative. After going through my website, readers will be a crazy fan for pandas.

For the PHP elements I incorporated, I made use of the includes feature. To make every page's header consistent, I put the header in a separate php file and just include it in my accessible pages. This way, I do not have to create the same header every single time I am working on a new page. Secondly, I made some checkboxes and a submit button. Upon submission, users will know whether they submit the correct answer. Lastly, I made an input box where users can enter some words. Upon submission, users can see the full sentence I made with the use of the words they just entered.

For the WOW elements, the website silly-themed yet interesting, with impressive stylings. Secondly, I made use of RegEx when considering those input content.
